

Validation Workflow

Page 1 of 2

Manual vs Automated Validation

Manual validation involves opening each PDF and using Ctrl+F or Adobe search. This becomes extremely time-consuming when you have dozens or hundreds of source documents.

Recommended automated approach:

1. Index all documents using a high-performance local search engine (Whoosh).
2. Search for key phrases or full sentences from the LLM response.
3. Review the returned snippets with file name + page/paragraph.
4. Confirm the LLM did not fabricate details.

Validation Workflow

Example of Good Grounding Check

LLM Response: "According to our internal policy, all AI-generated content must be validated using FastDocSearch or equivalent tool before being shared with clients or used in reports."

Search query used: "all AI-generated content must be validated using FastDocSearch"

Expected result: Should surface the exact paragraph from the policy PDF with correct page number and highlighted match.

This process typically takes under 10 seconds with a proper tool versus 15-30 minutes of manual document hunting.
